**TO THE QUESTION OF OSCILLATION OF SOLUTIONS
OF TWO-DIMENSIONAL DIFFERENTIAL SYSTEMS WITH
DEVIATED ARGUMENTS**

(Reported on February 26 and March 4, 1996)

Consider the system of differential inequalities

$$\begin{aligned} u_1'(t) \operatorname{sign} u_2(\sigma(t)) &\geq p(t)|u_2(\sigma(t))|, \\ u_2'(t) \operatorname{sign} u_1(\tau(t)) &\leq -q(t)|u_1(\tau(t))|, \end{aligned} \quad (1)$$

where $p, q : \mathbb{R}_+ \rightarrow \mathbb{R}_+$ are locally summable functions, $\tau, \sigma : \mathbb{R}_+ \rightarrow \mathbb{R}$ are nondecreasing continuous functions and $\sigma(t) \leq t$, $\sigma(\tau(t)) \leq t$ for $t \in \mathbb{R}_+$, $\lim_{t \rightarrow +\infty} \tau(t) = +\infty$, $\lim_{t \rightarrow +\infty} \sigma(t) = +\infty$.

Definition. A *proper* solution (u_1, u_2) of the system (1), i.e. a nontrivial solution defined in some neighbourhood of $+\infty$, is said to be *oscillatory* if both u_1 and u_2 have sequences of zeros tending to infinity. If there exists $t_0 \in \mathbb{R}_+$ such that $u_1(t)u_2(t) \neq 0$ for $t \geq t_0$, then (u_1, u_2) is said to be *nonoscillatory*.

In this paper, we are especially interested in the question whether every proper solution of (1) is oscillatory.

In the sequel, we assume that the condition

$$\int_0^{+\infty} p(s)ds = +\infty$$

is fulfilled.

Theorem 1. *Let for some $k \in \mathbb{N}$ and for any $t_0 \in \mathbb{R}_+$ the inequality*

$$\begin{aligned} \limsup_{t \rightarrow +\infty} \left(\int_{\sigma(\tau(t))}^t q(s)\omega_k(\sigma(\tau(s)), \sigma(\tau(t)); t_0) \int_{\eta_k(t_0)}^{\tau(s)} p(\xi)d\xi ds + \right. \\ \left. + g_k(\sigma(\tau(t)); t_0) \int_t^{+\infty} q(s)ds \right) > 1, \end{aligned}$$

be fulfilled, where

$$g_k(t; t_0) = \int_{\eta_k(t_0)}^t p(s)\omega_k(\sigma(s), s; t_0) ds +$$

1991 *Mathematics Subject Classification.* 34K15.

Key words and phrases. Two-dimensional differential system with deviated arguments, proper solution, oscillatory solution.

$$\begin{aligned}
& + \int_{\eta_k(t_0)}^t q(s)\psi_k(s; t_0) \int_{\eta_k(t_0)}^s p(\xi)\omega_k(\sigma(\xi), \xi; t_0) d\xi ds \quad \text{for } t \geq \eta_k(t_0), \\
& \omega_j(t, s; t_0) = \exp \left\{ \int_t^s q(\xi)\varphi_j(\xi; t_0) \int_{\eta_j(t_0)}^{\tau(\xi)} p(\xi_1) d\xi_1 d\xi \right\} \\
& \quad \text{for } s \geq t \geq \eta_j(t_0) \quad (j = 1, \dots, k), \\
& \varphi_1(t; t_0) = 1, \quad \varphi_j(t; t_0) = \omega_{j-1}(\sigma(\tau(t)), t; t_0) \quad \text{for } t \geq \eta_j(t_0) \quad (j = 2, \dots, k), \\
& \psi_1(t; t_0) = 0, \quad \psi_j(t; t_0) = \int_{\eta_{j-1}(t_0)}^{\sigma(\tau(t))} p(s) \exp \left\{ \int_{\sigma(s)}^t q(\xi)\psi_{j-1}(\xi; t_0) d\xi \right\} ds \quad (2) \\
& \quad \text{for } t \geq \eta_j(t_0) \quad (j = 2, \dots, k), \\
& \eta_1(t) = \max \left\{ s : \min(\sigma(\tau(\sigma(s))), \sigma(s)) \leq t \right\}, \quad \eta_j(t) = \eta_1(\eta_{j-1}(t)) \\
& \quad (j = 2, \dots, k).
\end{aligned}$$

Then every proper solution of (1) is oscillatory.

(In the case of second order differential inequalities, an analogous construction of the functions $\varphi_k, \psi_k, \eta_k$ can be found in [1]).

Theorem 2. Let for some $k \in \mathbb{N}$ and for any $t_0 \in \mathbb{R}_+$ the inequality

$$\limsup_{t \rightarrow +\infty} \psi_k(t; t_0) \int_t^{+\infty} q(s) ds > 1,$$

be fulfilled, where the function ψ_k is defined by (2).

Then every proper solution of (1) is oscillatory.
