ON ASYMPTOTIC BEHAVIOUR OF SOLUTIONS OF LINEAR
FUNCTIONAL DIFFERENTIAL EQUATIONS

(Reported on October 2 and 9, 1995)

Consider the equation

$$u^{(n)}(t) + \sum_{i=1}^m \int_{\tau_i(t)}^{\sigma_i(t)} u(s) d_s r_i(s, t) = 0, \quad (1)$$

where $n \geq 2$, $m \in N$, $\tau_i, \sigma_i \in C(R_+; R_+)$, $\tau_i(t) \leq \sigma_i(t) \leq t$ for $t \in R_+$, $\lim_{t \rightarrow +\infty} \tau_i(t) = +\infty$, ($i = 1, \dots, m$), the functions $r_i(s, t)$ are measurable, and $r_i(\cdot, t)$ is nondecreasing ($i = 1, \dots, m$).

Let $t_0 \in R_+$. A function $u : [t_0, +\infty[\rightarrow R$ is called a proper solution of the equation (1) if it is absolutely continuous along with its derivatives up to the $n - 1$ -th order inclusively,

$$\sup \{ |u(s)| : s \in [t, +\infty[\} > 0 \quad \text{for } t \geq t_0,$$

and there exists $\bar{u} \in C(R_+; R)$ such that $\bar{u}(t) \equiv u(t)$ for $t \in [t_0, +\infty[$ and

$$\bar{u}^{(n)}(t) + \sum_{i=1}^m \int_{\tau_i(t)}^{\sigma_i(t)} \bar{u}(s) d_s r_i(s, t) = 0$$

almost everywhere on $[t_0, +\infty[$. A proper solution $u : [t_0, +\infty[\rightarrow R$ is said to be oscillatory if it has a sequence of zeroes tending to $+\infty$. Otherwise the solution is said to be nonoscillatory.

Definition. We say that the equation (1) has the property *A* if each of its proper solutions is oscillatory when n is even, and either is oscillatory or satisfies $|u^{(i)}| \downarrow 0$ for $t \uparrow +\infty$ when ($i = 0, \dots, n - 1$) is odd.

Theorem. Let for some $i_0 \in \{1, \dots, m\}$ there exist a nondecreasing $\delta \in C(R_+; R_+)$ such that $\tau_{i_0}(t) \leq \delta(t) \leq \sigma_{i_0}(t)$ for $t \in R_+$,

$$\lim_{t \rightarrow +\infty} \int_{\delta(t)}^t \int_{\tau_{i_0}(s)}^{\delta(s)} \xi^{n-1} d_\xi r_{i_0}(\xi, s) ds > 0,$$

$$\text{vrai sup} \left\{ t \int_{\tau_{i_0}(t)}^{\delta(t)} s^{n-1} d_s r_{i_0}(s, t) : t \in R_+ \right\} < +\infty$$

1991 *Mathematics Subject Classification.* 34K15.

Key words and phrases. Functional differential equation, proper solution, equation with property *A*.

and

$$\overline{\lim}_{t \rightarrow +\infty} \frac{\ln t}{\ln \tau_i(t)} < +\infty \quad (i = 1, \dots, m). \quad (2)$$

Then the condition

$$\inf \left\{ \underline{\lim}_{t \rightarrow +\infty} \ln^\lambda t \int_t^{+\infty} \sum_{i=1}^m \int_{\tau_i(s)}^{\sigma_i(s)} \xi^{n-1} \times \right. \\ \left. \times \ln^{-\lambda} \xi d_\xi r_i(\xi, s) ds : \lambda \in]0, k] \right\} > (n-1)! \text{ for all } k \in N \quad (3)$$

is sufficient for the equation (1) to have the property A.

Corollary 1. Let $c_i \in]0, +\infty[$, $\alpha_i, \bar{\alpha}_i \in]0, 1]$, and $\alpha_i < \bar{\alpha}_i$ ($i = 1, \dots, m$). Then for the equation

$$u^{(n)}(t) + \sum_{i=1}^m \frac{c_i}{t} \int_{t^{\alpha_i}}^{t^{\bar{\alpha}_i}} \frac{u(s)}{s^n \ln^2 s} ds = 0$$

to have the property A, it is sufficient that

$$\inf \left\{ \frac{1}{\lambda(\lambda+1)} \sum_{i=1}^m c_i (\alpha_i^{-\lambda-1} - \bar{\alpha}_i^{-\lambda-1}) : \lambda \in]0, +\infty[\right\} > (n-1)!$$

Corollary 2. Let $c_i \in]0, +\infty[$, $\alpha_i \in]0, 1]$, and $\alpha_{i_0} < 1$ for some $i_0 \in \{1, \dots, m\}$. Then for the equation

$$u^{(n)}(t) + \frac{1}{t \ln t} \sum_{i=1}^m \frac{c_i}{t^{\alpha_i(n-1)}} u(t^{\alpha_i}) ds = 0$$

to have the property A, it is sufficient that

$$\inf \left\{ \frac{1}{\lambda} \sum_{i=1}^m c_i \alpha_i^{-\lambda} : \lambda \in]0, +\infty[\right\} > (n-1)!$$

In the case where the condition

$$\overline{\lim}_{t \rightarrow +\infty} \frac{t}{\tau_i(t)} < +\infty \quad (i = 1, \dots, m)$$

holds instead of (2), analogous questions are considered in [1].

Remark. Note that the inequality (2) cannot be replaced by

$$\inf \left\{ \underline{\lim}_{t \rightarrow +\infty} \ln^\lambda t \int_t^{+\infty} \sum_{i=1}^m \int_{\tau_i(s)}^{\sigma_i(s)} \xi^{n-1} \times \right. \\ \left. \times \ln^{-\lambda} \xi d_\xi r_i(\xi, s) ds : \lambda \in]0, k] \right\} > (n-1)! - \varepsilon$$

for any whatever small ε .
